**Table 3.** Migration rate estimates estimated using MSC-M. Migration rates are given in units M (=Nm) and shown are posterior means and 95% highest posterior density confidence interval (HPD CI) between the 10 populations of *Elgaria coerulea*. Sample sizes (N) and number of loci are listed for each comparison. Population codes are as follows: CRN = Coast Range North, CRS = Coast Range South, LC = Lower Cascades, NC = Northern California, PNW = Pacific Northwest, SNC1 = Sierra Nevada Central 1, SNC2 = Sierra Nevada Central 2, SNN1 = Sierra Nevada North 1, SNN2 = Sierra Nevada North 2, SNS = Sierra Nevada South.

**Figure S1.** ADMIXTURE analysis results for estimating population structure in *Elgaria coerulea*. The number of populations (K) was compared using cross-validation (CV) scores for K values ranging from 1 to 12. Analyses were conducted with datasets with different levels of missing data: 50% (purple) and 10% (blue). Ten replicate analyses (run1 – run10) were performed under each K value. The optimal K value is the run with the lowest CV score. We selected K = 10 as the optimal value using the 10% missing data threshold.

**Figure S2.** Principal Component Analysis (PCA) scatterplot of the *Elgaria coerulea* SNP data using the program Adegenet.
